

# About m-domination number of graphs

D. K. Thakkar<sup>1</sup> and Neha P. Jamvecha<sup>2\*</sup>

## Abstract

In this paper, we have defined the concept of m-dominating set in graphs. In order to define this concept we have used the notion of m-adjacent vertices. We have also defined the concepts of minimal m-dominating set, minimum m-dominating set and m-domination number which is the minimum cardinality of an m-dominating set. We prove that the complement of a minimal m-dominating set is an m-dominating set. Also we prove a necessary and sufficient condition under which the m-domination number increases or decreases when a vertex is removed from the graph. Further we have also studied the concept of m-removing a vertex from the graph and we prove that the m-removal of a vertex from the graph always increases or does not change the m-domination number. Some examples have also been given.

## Keywords

m-dominating set, minimal m-dominating set, minimum m-dominating set, private m-neighbourhood of a vertex, m-removal of a vertex.

## 1. Introduction

In the area of mixed domination several new concepts have been appeared. The concept of a vertex which m-dominates an edge and the concept of an edge which m-dominates a vertex have been defined and studied by some authors like R. Laskar, K. Peters, E. Sampathkumar, S. S. Kamath and others [3–5]. The above concepts can be used to define m-adjacent vertices and m-adjacent edges. In fact, we have defined m-adjacent vertices and m-adjacent edges in [1]. We observe that these concepts give rise to new concept called m-dominating set using m-adjacent vertices.

We also introduce the concepts of minimal m-dominating set, minimum m-dominating set and m-domination number which is the minimum cardinality of an m-dominating set.

We have also a concept called m-removal of a vertex in graphs which has been introduced in [2]. We proved the effect of m-removing a vertex on m-domination number.

## 2. Preliminaries and Notations

If  $G$  is a graph then  $E(G)$  denotes the edge set and  $V(G)$  denotes the vertex set of the graph. If  $v$  is a vertex of  $G$  then  $G \setminus v$  denotes the subgraph of  $G$  obtained by removing the vertex  $v$  and all the edges incident to  $v$ .  $N(v)$  denotes the set of vertices which are adjacent to  $v$ .  $N[v] = N(v) \cup v$ . If  $x$  is any vertex then  $d(x)$  denotes the degree of  $x$  and is the number of edges incident at  $x$ .

**Definition 2.1.** [1] Let  $u$  and  $v$  be two vertices of  $G$ . Then  $u$  and  $v$  are said to be m-adjacent vertices in  $G$  if there is an edge of  $G$  which m-dominates both  $u$  and  $v$  in  $G$ .

**Definition 2.2.** [2] Let  $G$  be a graph and  $v \in V(G)$ . We obtain a subgraph of  $G$  by removing vertex  $v$  and certain edges which is called the subgraph obtained by m-removing the vertex  $v$  from the graph  $G$ .

**Definition 2.3.** [2] Let  $G$  be a graph and  $v \in V(G)$ . The subgraph obtained by m-removing vertex  $v$  from  $G$  has the vertex set  $V(G) \setminus \{v\}$  and by removing all the edges of  $G$  which m-dominate vertex  $v$ . This subgraph is denoted as  $G \setminus^m \{v\}$ .

### 3. Main Results

**Definition 3.1.** Let  $G$  be a graph and  $S \subset V(G)$ . Then  $S$  is said to be an  $m$ -dominating set if for every vertex  $v$  in  $V(G) \setminus S$ , there is a vertex  $u$  in  $S$  such that  $u$  and  $v$  are  $m$ -adjacent.

Note that every dominating set is an  $m$ -dominating set but  $m$ -dominating set need not be a dominating set.

**Example 3.2.** Consider the path graph  $P_5$  with vertices  $\{v_1, v_2, v_3, v_4, v_5\}$

Figure 1.  $P_5$

Let  $S = \{v_3\}$  then  $S$  is an  $m$ -dominating set but not dominating set.

**Definition 3.3.** Let  $G$  be a graph and  $S \subset V(G)$  be an  $m$ -dominating set. Then  $S$  is said to be a minimal  $m$ -dominating set if  $S \setminus \{v\}$  is not an  $m$ -dominating set for every  $v$  in  $S$ .

**Definition 3.4.** An  $m$ -dominating set with minimum cardinality is called a minimum  $m$ -dominating set. The cardinality of minimum  $m$ -dominating set is the  $m$ -domination number of the graph  $G$  and it is denoted as  $\gamma_{mv}(G)$ .

**Definition 3.5.** Let  $G$  be a graph and  $v \in V(G)$ . Then  $v$  is said to be an  $m$ -isolated vertex of  $G$  if for every other vertex  $u$  of  $G$ ,  $u$  is not  $m$ -adjacent to  $v$ .

Obviously, a vertex  $v$  is isolated if and only if it is  $m$ -isolated.

**Theorem 3.6.** Let  $G$  be a graph and  $S \subset V(G)$  be an  $m$ -dominating set of  $G$ . Then  $S$  is a minimal  $m$ -dominating set of  $G$  if and only if for every  $u \in S$  at least one of the following two conditions holds.

- (i)  $u$  is not  $m$ -adjacent to any other vertex of  $S$ .
- (ii) There exist a vertex  $v \in V(G) \setminus S$  such that  $v$  is  $m$ -adjacent to only one vertex of  $S$  namely  $u$ .

*Proof.* Suppose  $S$  is a minimal  $m$ -dominating set. Let  $u \in S$ . Now  $S \setminus \{u\}$  is not an  $m$ -dominating set. Therefore, there is a vertex  $v$  outside  $S \setminus \{u\}$  such that  $v$  is not  $m$ -adjacent to any vertex of  $S \setminus \{u\}$ .

**Case (i):**  $v = u$

Then  $u$  is not  $m$ -adjacent to any other vertex of  $S$ .

**Case (ii):**  $v \neq u$

Then  $v \notin S$ .

**Subcase (i):**  $v$  is not  $m$ -adjacent to any vertex of  $S \setminus \{u\}$ .

**Subcase (ii):**  $v$  is  $m$ -adjacent to some vertex of  $S$ .

Therefore,  $v$  is  $m$ -adjacent to only one vertex of  $S$  namely  $u$ .

Conversely, suppose any of condition (i) and (ii) is satisfied for any  $u \in S$ .

Let  $u \in S$ .

**Case (i):** Suppose condition (i) is satisfied.

Therefore,  $u$  is not  $m$ -adjacent to any vertex of  $S \setminus \{u\}$  and also  $u \notin S \setminus \{u\}$ .

**Case (ii):** Suppose condition (ii) is satisfied.

Let  $v \in V(G) \setminus S$  such that  $v$  is  $m$ -adjacent to only one vertex of  $S$  namely  $u$ . Then  $v$  is not  $m$ -adjacent to any vertex of  $S \setminus \{u\}$ . Thus it follows that  $S \setminus \{u\}$  is not an  $m$ -dominating set of  $G$  for any  $u \in S$ .

Therefore,  $S$  is a minimal  $m$ -dominating set. □

**Theorem 3.7.** Let  $G$  be a graph without  $m$ -isolated vertices and  $S$  be a minimal  $m$ -dominating set of  $G$ . Then  $V(G) \setminus S$  is an  $m$ -dominating set of  $G$ .

*Proof.* Let  $v \in S$ . Since  $S$  is a minimal  $m$ -dominating set, (i) or (ii) of theorem (3.6) is satisfied.

Suppose (i) is satisfied. Then  $v$  is not  $m$ -adjacent with any other vertex of  $S$ . Since  $v$  is not an  $m$ -isolated vertex of  $G$ ,  $v$  is  $m$ -adjacent to some vertex  $u$  of  $G$ . Then  $u \in V(G) \setminus S$ .

Suppose (ii) is satisfied and suppose  $v$  is  $m$ -adjacent to some vertex of  $S$ . Now, there is a vertex  $u$  in  $V(G) \setminus S$  such that  $u$  is  $m$ -adjacent to  $v$  and  $u$  is not  $m$ -adjacent to any other vertex of  $S$ .

Thus in both the cases  $v$  is  $m$ -adjacent to some vertex of  $V(G) \setminus S$ . Therefore,  $V(G) \setminus S$  is an  $m$ -dominating set of  $G$ . □

**Corollary 3.8.** Let  $G$  be a graph without  $m$ -isolated vertices. Then  $\gamma_{mv}(G) \leq n/2$ .

*Proof.* Let  $S$  be a minimum  $m$ -dominating set of  $G$ . Then  $\gamma_{mv}(G) = |S|$ . Now by the theorem(3.7),  $V(G) \setminus S$  is also an  $m$ -dominating set. Therefore,  $\gamma_{mv}(G) \leq |V(G) \setminus S|$ . Therefore,  $\gamma_{mv}(G) = \min\{|S|, |V(G) \setminus S|\}$ . If  $|S| \leq n/2$  then  $\gamma_{mv}(G) \leq n/2$ . If  $|V(G) \setminus S| > n/2$  then  $|S| < n/2$  and therefore  $\gamma_{mv}(G) \leq n/2$ . □

**Definition 3.9.** Let  $G$  be a graph and  $x \in V(G)$ . The  $m$ -vertex open neighbourhood of  $x$  (or simply  $m$ -open neighbourhood of  $x$ ) is the set  $N_{mv}(x) = \{u \in V(G) \text{ such that } u \text{ is } m\text{-adjacent to } x\}$ .

Also the  $m$ -vertex closed neighbourhood of  $x$  is the set  $N_{mv}[x] = N_{mv}(x) \cup \{x\}$ .

Now we state and prove a necessary and sufficient condition under which the  $m$ -domination number of a graph increases when a vertex is removed from the graph.

**Theorem 3.10.** Let  $G$  be a graph and  $v \in V(G)$ . Then  $\gamma_{mv}(G \setminus v) > \gamma_{mv}(G)$  if and only if following conditions are satisfied

- (i)  $v$  is not an  $m$ -isolated vertex of  $G$ .

- (ii) If  $S$  is a minimum  $m$ -dominating set of  $G$  and  $v \notin S$  then there is a vertex  $x$  in  $V(G) \setminus S$  such that  $x \neq v$  and  $d(x, S) > 3$  in the subgraph  $G \setminus v$ .
- (iii) There is no subset  $S$  of  $V(G) \setminus N_{mv}[v]$  such that  $|S| \leq \gamma_{mv}(G)$  and it is an  $m$ -dominating set of  $G \setminus v$ .

*Proof.* Suppose  $\gamma_{mv}(G \setminus v) > \gamma_{mv}(G)$ .

- (i) Suppose  $v$  is an  $m$ -isolated vertex of  $G$ . Let  $S$  be any minimum  $m$ -dominating set of  $G$ . Then  $v \in S$ . Let  $S_1 = S \setminus \{v\}$ . Let  $x$  be any vertex of  $G \setminus v$  such that  $x \notin S_1$ . Then,  $x \notin S$ . Since  $S$  is an  $m$ -dominating set of  $G$ ,  $d(x, S) \leq 3$  in  $G$ . Now  $v$  is an  $m$ -isolated vertex,  $d(x, S_1)$  in  $G = d(x, S_1)$  in  $G \setminus v$ . Therefore,  $d(x, S_1)$  in  $G \setminus v \leq 3$ . Thus,  $x$  is  $m$ -adjacent to some member of  $S_1$  in  $G \setminus v$ . This proves that  $S_1$  is an  $m$ -dominating set in  $G \setminus v$ . Therefore  $\gamma_{mv}(G \setminus v) \leq |S_1| < |S| = \gamma_{mv}(G)$ , which is a contradiction. Therefore,  $v$  cannot be an  $m$ -isolated vertex of  $G$ .
- (ii) Suppose, there is a minimum  $m$ -dominating set  $S$  of  $G$  such that  $v \notin S$ . Suppose for every vertex  $x$  which is not in  $S$  and  $x \neq v$ ,  $d(x, S) \leq 3$  in  $G \setminus v$ . Then  $S$  is an  $m$ -dominating set in  $G \setminus v$ . This implies that  $\gamma_{mv}(G \setminus v) \leq |S| = \gamma_{mv}(G)$  which is a contradiction. Therefore (ii) is satisfied.
- (iii) Suppose, there is a subset  $S$  of  $V(G) \setminus N_{mv}[v]$  such that  $|S| \leq \gamma_{mv}(G)$  and  $S$  is an  $m$ -dominating set of  $G \setminus v$ . Then  $\gamma_{mv}(G \setminus v) \leq |S| \leq \gamma_{mv}(G)$  which is again a contradiction. Therefore, (iii) holds.

Conversely, suppose condition (i), (ii) and (iii) are satisfied. First suppose that  $\gamma_{mv}(G \setminus v) = \gamma_{mv}(G)$ . Let  $S$  be a minimum  $m$ -dominating set of  $G \setminus v$ . Let  $x$  be any vertex of  $G$  such that  $x \notin S$  and  $x \neq v$ . Then  $d(x, S)$  in  $G \leq d(x, S)$  in  $G \setminus v$  which is  $\leq 3$ . Now suppose  $v$  is  $m$ -adjacent to some vertex of  $S$ . Then  $S$  is a minimum  $m$ -dominating set of  $G$  and  $v \notin S$ . If  $x \in V(G) \setminus S$  such that  $x \neq v$  then  $d(x, S) \leq 3$  in  $G \setminus v$ . This contradicts condition (ii). Therefore,  $v$  cannot be an  $m$ -adjacent to any vertex of  $S$ . Then  $S$  is a subset of  $V(G) \setminus N_{mv}[v]$ . Also,  $|S| \leq \gamma_{mv}(G)$ . Also,  $S$  is an  $m$ -dominating set of  $G \setminus v$ . This contradicts condition (iii). Thus,  $\gamma_{mv}(G \setminus v) = \gamma_{mv}(G)$  is not possible.

Suppose,  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$ .

Let  $S$  be a minimum  $m$ -dominating set of  $G \setminus v$ . Since  $|S| < \gamma_{mv}(G)$ ,  $S$  cannot be an  $m$ -dominating set of  $G$ . Therefore,  $v$  cannot be  $m$ -adjacent to any vertex of  $G$ . Therefore,  $S$  is a subset of  $V(G) \setminus N_{mv}[v]$ . Also  $|S| \leq \gamma_{mv}(G)$ . Also  $S$  is an  $m$ -dominating set of  $G \setminus v$ . This again contradicts (iii). Therefore,  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$  is also not possible. Thus,  $\gamma_{mv}(G \setminus v) > \gamma_{mv}(G)$ .  $\square$

**Corollary 3.11.** Let  $G$  be a graph and  $v \in V(G)$  be such that  $\gamma_{mv}(G \setminus v) > \gamma_{mv}(G)$  then  $d(v, S) \leq 2$  for every minimum  $m$ -dominating set  $S$  of  $G$ .

*Proof.* Let  $S$  be any minimum  $m$ -dominating set of  $G$ . Suppose  $v \notin S$ . By (ii) of theorem(3.10), there is a vertex  $x$  in  $V(G) \setminus S$  such that  $d(x, S) > 3$  in  $G \setminus v$ . However,  $d(x, S) \leq 3$  in  $G$ . Therefore, there is a vertex  $y$  in  $S$  such that  $d(x, y) \leq 3$ . Any path from  $x$  to  $y$  in  $G$  must contain  $v$  as an internal vertex (otherwise  $v$  does not appear in the path and therefore there is a path of length less than or equal to 3 between  $x$  and  $y$  in  $G \setminus v$ ). Obviously, there is a path from  $v$  to  $y$  of length  $\leq 2$ . Therefore,  $d(v, S) \leq 2$ .  $\square$

**Definition 3.12.** Let  $G$  be a graph,  $v \in V(G)$  and  $S \subset V(G)$  such that  $v \in S$ . Then private  $m$ -neighbourhood of  $v$  with respect to  $S$  is defined as  $P_{mn}[v, S] = \{u \in V(G) \text{ such that } N_{mv}[u] \cap S = \{v\}\}$ .

**Remark 3.13.** Note that if  $v \in S$  and  $v$  is not  $m$ -adjacent to any other vertex of  $S$  then  $v \in P_{mn}[v, S]$ . If  $u \in V(G) \setminus S$  then  $u \in P_{mn}[v, S]$  if and only if  $u$  is  $m$ -adjacent to only one vertex of  $S$  namely  $v$ .

Now we state and prove a necessary and sufficient condition under which the  $m$ -domination number of a graph decreases when a vertex is removed from the graph.

**Theorem 3.14.** Let  $G$  be a graph and  $v \in V(G)$ . Then  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$  if and only if there is a minimum  $m$ -dominating set  $S$  of  $G$  such that  $v \in S$  and  $P_{mn}[v, S] = \{v\}$ .

*Proof.* Suppose  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$ . Let  $S_1$  be a minimum  $m$ -dominating set of  $G \setminus v$ . Then  $S_1$  cannot be an  $m$ -dominating set of  $G$ . Therefore,  $d(v, S_1) > 3$ . Let  $S = S_1 \cup \{v\}$ . Let  $x \in V(G) \setminus S$  then  $x \notin S_1$ . Since  $S_1$  is an  $m$ -dominating set of  $G \setminus v$ ,  $x$  is  $m$ -adjacent to some vertex  $z$  of  $S_1$  in  $G \setminus v$ . Then  $x$  is  $m$ -adjacent to  $z$  in  $G$  also. Thus  $S$  is an  $m$ -dominating set of  $G$  and  $v \in S$ . Note that as mentioned above  $v$  is not  $m$ -adjacent to any other vertex of  $S$  in  $G$ . Therefore,  $v \in P_{mn}[v, S]$ . Let  $x \in V(G) \setminus S$  such that  $x$  is  $m$ -adjacent to  $v$  in  $G$ . Now,  $x$  is  $m$ -adjacent to  $y$  in  $S$  (in  $G \setminus v$ ) such that  $y \neq v$ . Then  $x$  is also  $m$ -adjacent to  $y$  in  $G$ . Thus  $x$  is  $m$ -adjacent to two distinct vertices of  $S$ . Therefore,  $x \notin P_{mn}[v, S]$  if  $x \in V(G) \setminus S$ . Thus  $P_{mn}[v, S] = \{v\}$ .

Conversely, suppose there is a minimum  $m$ -dominating set  $S$  of  $G$  such that  $v \in S$  and  $P_{mn}[v, S] = \{v\}$ . Let  $S_1 = S \setminus \{v\}$ . Let  $x$  be a vertex of  $G \setminus v$  such that  $x \notin S_1$ . Then  $x \notin S$ . Since  $S$  is an  $m$ -dominating set of  $G$ ,  $x$  is  $m$ -adjacent to some vertex  $y$  of  $S$ . Suppose  $y = v$ . Now  $x \notin P_{mn}[v, S]$ . Therefore,  $x$  is  $m$ -adjacent to some vertex  $z$  of  $S$  in  $G$  such that  $z \neq v$ . Therefore,  $d(x, z) \leq 3$  in  $G$ . Let  $P$  be a path in  $G$  joining  $x$  to  $z$ . If  $v$  is a vertex in this path then it will imply that  $d(v, z) \leq 3$  and this implies that  $v$  is  $m$ -adjacent to  $z$  and  $z \in S$ . This contradicts the fact that  $v \in P_{mn}[v, S]$ . Thus,  $v$  does not appear in this path. Thus  $P$  is a path in  $G \setminus v$  joining  $x$  to  $z$ . Therefore,  $x$  is  $m$ -adjacent to  $z$  in  $G \setminus v$  and  $z \in S_1$ . Thus  $S_1$  is an  $m$ -dominating set in  $G \setminus v$ . Thus,  $\gamma_{mv}(G \setminus v) \leq |S_1| < |S| = \gamma_{mv}(G)$ .  $\square$

**Corollary 3.15.** Let  $G$  be a graph and  $v \in V(G)$  be such that  $v$  is not  $m$ -isolated vertex of  $G$ . If  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$  then there is a minimum  $m$ -dominating set  $S$  such that  $v \notin S$ .

*Proof.* There is a minimum m-dominating set  $S_1$  of  $G$  such that  $v \in S_1$  and  $P_{mn}[v, S_1] = \{v\}$ . Since  $v$  is not an m-isolated vertex in  $G$ , there is a vertex  $x$  which is m-adjacent to  $v$  in  $G$ . Since  $v$  is not m-adjacent to any vertex of  $S_1$ ,  $x \in V(G) \setminus S_1$ . Let  $S = (S_1 \setminus \{v\}) \cup \{x\}$ . Then  $|S| = |S_1| = \gamma_{mv}(G)$ . Also  $v \notin S$ . Let  $z \in V(G) \setminus S$ . If  $z = v$  then  $z$  is m-adjacent to  $x$  and  $x \in S$ . Suppose  $z \neq v$ . Then  $z \notin S_1$ . Since  $S_1$  is an m-dominating set of  $G$ ,  $z$  is m-adjacent to some vertex  $t$  of  $S_1$ . If  $t = v$  then  $z$  is m-adjacent to some vertex  $t'$  of  $S_1$  such that  $t' \neq v$  because  $z \notin P_{mn}[v, S_1]$ . Thus,  $z$  is m-adjacent to some vertex  $t'$  of  $S$ . Thus  $S$  is an m-dominating set of  $G$ . Thus,  $S$  is a minimum m-dominating set of  $G$  such that  $v \notin S$ .  $\square$

**Theorem 3.16.** *Let  $G$  be a graph and  $v \in V(G)$  such that  $v$  is not an m-isolated vertex in  $G$ . Then  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$  if and only if there is a minimum m-dominating set  $S$  not containing  $v$  and a vertex  $x$  in  $S$  such that  $P_{mn}[x, S] = \{v\}$ .*

*Proof.* Suppose  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$ . By theorem(3.14), there is a minimum m-dominating set  $S_1$  such that  $v \in S_1$  and  $P_{mn}[v, S_1] = \{v\}$ . Let  $x$  be a vertex in  $V(G) \setminus S_1$ , which is adjacent to  $v$ . Let  $S = (S_1 \setminus \{v\}) \cup \{x\}$ . Then  $x \in S$  and by the corollary(3.15),  $S$  is a minimum m-dominating set of  $G$  not containing  $v$ . Note that  $v$  is not m-adjacent to any vertex of  $S_1$  because  $v \in P_{mn}[v, S_1]$ . Therefore,  $v$  is adjacent to only one vertex of  $S$  namely  $x$ . Thus  $v \in P_{mn}[x, S]$ . Again  $x$  is m-adjacent to  $v$  and since  $x \notin P_{mn}[v, S_1]$ ,  $x$  is m-adjacent to some vertex  $y$  of  $S_1$  where  $y \neq v$ . Therefore,  $x$  is m-adjacent to some vertex of  $S$  and therefore  $x \notin P_{mn}[x, S]$ . Let  $z$  be a vertex of  $V(G) \setminus S$  such that  $z$  is m-adjacent to  $x$ . Since  $z \notin S_1$ ,  $z$  is m-adjacent to some vertex  $w$  of  $S_1$  because  $S_1$  is an m-dominating set of  $G$ . Thus,  $z$  is m-adjacent to two distinct vertices of  $S$  namely  $x$  and  $w$ . Therefore,  $z \notin P_{mn}[x, S]$ . Hence,  $P_{mn}[x, S] = \{v\}$ .

Conversely, suppose there is a minimum m-dominating set  $S$  such that  $v \notin S$  and for some vertex  $x$  in  $S$ ,  $P_{mn}[x, S] = \{v\}$ . Let  $S_1 = S \setminus \{x\}$ . Now,  $x \notin P_{mn}[x, S]$ . Therefore,  $x$  is m-adjacent to some vertex  $y$  of  $S$  in  $G$ . Note that  $v$  is not m-adjacent to any vertex of  $S$  except  $x$ . Let  $P$  be a path in  $G$  from  $x$  to  $y$  whose length is  $\leq 3$ . If  $v$  is an internal vertex in this path then it would imply that  $d(v, y) \leq 3$  in  $G$  and this means that  $v$  is m-adjacent to  $y$  in  $G$  and  $y \neq x$ . This is a contradiction. Thus  $v$  cannot appear as an internal vertex in the path above from  $x$  to  $y$ . Therefore, this is a path in  $G \setminus v$  from  $x$  to  $y$  having length  $\leq 3$ . Thus  $x$  is m-adjacent to  $y$  in  $G \setminus v$  and  $y \in S_1$ . Let  $z$  be any vertex of  $G \setminus v$  such that  $z \notin S_1$  and  $z \neq x$ . Then  $z \notin S$ . Now,  $z$  is m-adjacent to some vertex  $w$  of  $S$  in  $G$ . If  $w = x$  then there is another vertex  $w'$  in  $S$  such that  $z$  is m-adjacent to  $w'$  in  $G$ . By the same reasoning as given above we say that  $z$  is m-adjacent to  $w'$  in  $G \setminus v$  also. Also  $w' \in S_1$ . Thus, we have proved that  $S_1$  is an m-dominating set of  $G \setminus v$ . Therefore,  $\gamma_{mv}(G \setminus v) \leq |S_1| < |S| = \gamma_{mv}(G)$ . Hence,  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$ .  $\square$

**Example 3.17.** *Consider the path graph  $P_8$  with vertices  $\{v_1, v_2, v_3, v_4, v_5, v_6, v_7, v_8\}$*

Figure 2.  $P_8$

Here,  $\gamma_{mv}(G) = 2$  and  $\gamma_{mv}(G \setminus \{v_8\}) = 1$ . Let  $S = \{v_4, v_5\}$ . Then  $P_{mn}[v_5, S] = \{v_8\}$

**Corollary 3.18.** *Let  $G$  be a graph and  $v \in V(G)$  be such that  $d(v, S) = 3$  for every minimum m-dominating set  $S$  of  $G$ . Then  $\gamma_{mv}(G \setminus v) = \gamma_{mv}(G)$ .*

*Proof.* If  $\gamma_{mv}(G \setminus v) > \gamma_{mv}(G)$  then  $d(v, S) \leq 2$  for every minimum m-dominating set  $S$  of  $G$  which is a contradiction. If  $\gamma_{mv}(G \setminus v) < \gamma_{mv}(G)$  then there is a minimum m-dominating set  $S$  of  $G$  such that  $d(v, S) = 0$  which is again a contradiction. Therefore,  $\gamma_{mv}(G \setminus v) = \gamma_{mv}(G)$ .  $\square$

**Proposition 3.19.** *Let  $G$  be a graph and  $F$  be a set of edges of  $G$ . Then  $\gamma_{mv}(G \setminus F) \geq \gamma_{mv}(G)$ .*

*Proof.* Let  $S$  be a minimum m-dominating set of  $G \setminus F$ . Let  $x \in V(G) \setminus S$ . Now,  $x$  is m-adjacent to some vertex  $y$  of  $S$  in  $G \setminus F$ . Therefore, there is an edge  $e$  in the graph  $G \setminus F$  which m-dominates both  $x$  and  $y$ . Therefore,  $e$  m-dominates  $x$  and  $y$  in  $G$  also. Therefore,  $x$  and  $y$  are m-adjacent in  $G$  also. Thus,  $x$  is m-adjacent to some vertex  $y$  of  $S$  in  $G$ . Therefore,  $\gamma_{mv}(G \setminus F) \geq |S| = \gamma_{mv}(G)$ .  $\square$

**Proposition 3.20.** *Let  $G$  be a graph and  $v \in V(G)$ . Then,  $\gamma_{mv}(G \setminus \{v\}) \geq \gamma_{mv}(G \setminus v)$ .*

*Proof.* Note that  $G \setminus \{v\}$  is obtained by removing those edges of  $G$  which m-dominate  $v$  but which are not incident to  $v$ . These are the edges of  $G \setminus v$ . Let  $F$  be the set of these edges. Then by the proposition(3.19),  $\gamma_{mv}(G \setminus \{v\}) = \gamma_{mv}((G \setminus v) \setminus F) \geq \gamma_{mv}(G \setminus v)$ .  $\square$

**Proposition 3.21.** *Let  $G$  be a graph and  $v \in V(G)$  be a non-isolated vertex of  $G$ . Then  $\gamma_{mv}(G \setminus \{v\}) \geq \gamma_{mv}(G)$ .*

*Proof.* Let  $T$  be a minimum m-dominating set of  $G \setminus \{v\}$ . Then  $T$  contains all m-isolated vertices of  $G \setminus \{v\}$ . Now every neighbour of  $v$  is an m-isolated vertex of  $G \setminus \{v\}$ . Therefore, every neighbour of  $v$  is an element of  $T$ . Thus  $T$  is an m-dominating set of  $G$ . Therefore,  $\gamma_{mv}(G) \leq |T| = \gamma_{mv}(G \setminus \{v\})$ .  $\square$

**Theorem 3.22.** *Let  $G$  be a graph and  $v \in V(G)$  be such that  $d(v) \geq 2$ . Then  $\gamma_{mv}(G \setminus \{v\}) > \gamma_{mv}(G)$ .*

*Proof.* Suppose  $S$  is a minimum m-dominating set of  $G \setminus \{v\}$ . Let  $S_1 = (S \setminus N(v)) \cup \{v\}$ . Then  $|S_1| < |S|$ . Let  $x$  be any vertex of  $G$  such that  $x \notin S_1$ . If  $x \in N(v)$  then  $x$  is adjacent to  $v$  and of course  $v \in S_1$ . Suppose,  $x \notin N(v)$ . Then  $x \notin S$  and also  $x \neq v$ . Thus  $x$  is a vertex of  $G \setminus \{v\}$  and  $x \notin S$ . Therefore,  $x$  is m-adjacent to some vertex  $y$  of  $S$ . Therefore,  $d(x, y) \leq 3$

in  $G \setminus^m \{v\}$ . Since elements of  $N(v)$  are isolated vertices in  $G \setminus^m \{v\}$ ,  $y \notin N(v)$  and hence  $y \in S_1$ . Also  $d(x,y) \leq 3$  in  $G$ . Thus,  $x$  is m-adjacent to  $y$  where  $y \in S_1$ . Thus,  $S_1$  is an m-dominating set in  $G$ . Therefore,  $\gamma_{mv}(G) \leq |S_1| < |S| = \gamma_{mv}(G \setminus^m \{v\})$ .  $\square$

**Definition 3.23.** Let  $G$  be a graph,  $S \subset V(G)$  and  $v \in S$ . Then the external private m-neighbourhood of  $v$  with respect to  $S$  is  $E_x P_{m,n}[v, S] = \{w \in V(G) \setminus S \text{ such that } w \text{ is m-adjacent to } v \text{ in } G \text{ but } w \text{ is not m-adjacent to any other member of } S\}$ .

**Theorem 3.24.** Let  $G$  be a graph.  $v$  be a pendant vertex of  $G$  and  $u$  be its neighbour. Then  $\gamma_{mv}(G \setminus^m \{v\}) = \gamma_{mv}(G)$  if and only if there is a minimum m-dominating set  $S$  of  $G$  such that  $u \in S$ ,  $v \notin S$  and  $E_x P_{m,n}[u, S] \subseteq \{v\}$ .

*Proof.* It is already true that  $\gamma_{mv}(G \setminus^m \{v\}) \geq \gamma_{mv}(G)$ . Suppose there is a minimum m-dominating set  $S$  of  $G$  such that  $u \in S$ ,  $v \notin S$  and the condition is satisfied. Let  $x$  be a vertex of  $G \setminus^m \{v\}$  such that  $x \notin S$ . Now  $x$  is m-adjacent to some vertex  $y$  of  $S$  in  $G$ . If  $y = u$  then  $x$  is not m-adjacent to  $u$  in  $G \setminus^m \{v\}$ . Since the condition is satisfied,  $x$  is m-adjacent in  $G \setminus^m \{v\}$  to some vertex  $z$  of  $S$  such that  $z \neq u$ . If  $x$  is not m-adjacent to  $u$  then  $x$  is m-adjacent in  $G$  to some vertex  $w$  in  $S$  such that  $w \neq u$ . Then  $x$  is m-adjacent to  $w$  in  $G \setminus^m \{v\}$  also ( $\because$  The path joining  $x$  and  $w$  cannot contain  $u$  as  $x$  is not m-adjacent to  $u$ ). Thus from both the above cases it follows that  $S$  is an m-dominating set in  $G \setminus^m \{v\}$ . Thus,  $\gamma_{mv}(G \setminus^m \{v\}) \leq |S| = \gamma_{mv}(G)$ . Hence,  $\gamma_{mv}(G \setminus^m \{v\}) = \gamma_{mv}(G)$ .

Conversely, suppose  $\gamma_{mv}(G \setminus^m \{v\}) = \gamma_{mv}(G)$ . Let  $S$  be a minimum m-dominating set of  $G \setminus^m \{v\}$ . Since  $u$  is an isolated vertex in  $G \setminus^m \{v\}$ ,  $u \in S$ . Obviously,  $v \notin S$ . Let  $z$  be a vertex such that  $z \notin S$  and  $z \neq v$ . Suppose,  $z$  is m-adjacent to  $u$  in  $G$ . Since  $S$  is an m-dominating set of  $G \setminus^m \{v\}$ ,  $z$  is m-adjacent in  $G \setminus^m \{v\}$  to some vertex  $u'$  of  $S$ . Note that  $u' \neq u$  because  $u$  is an isolated vertex in  $G \setminus^m \{v\}$ . Now  $d(z, u') \leq 3$  in  $G \setminus^m \{v\}$ . Therefore,  $d(z, u') \leq 3$  in  $G$ . Thus we have proved that  $z \in V(G) \setminus S$ ,  $z \neq v$  and if  $z$  is m-adjacent to  $u$  in  $G$  then  $z$  is also m-adjacent to some other vertex  $u'$  of  $S$  in  $G \setminus^m \{v\}$ . Note that  $S$  is an m-dominating set in  $G$  also. Since  $\gamma_{mv}(G \setminus^m \{v\}) = \gamma_{mv}(G)$ ,  $S$  is a minimum m-dominating set of  $G$  and the condition is satisfied.  $\square$
